A) Project Title

Get Up & Go

Your new way to get out – discover local Happenings, level up with friends, and venture outside.

B) Conceptualisation & Problem Statement

Prompt Cards & Inspiration

Goal Theme: “Break a habit”

- Combating sedentary lifestyle and stay-at-home inertia.

Interaction: “Geolocation”

- Recommending real-world events within customisable radius bounds.

Constraint: “One hand use only”

- Bottom-anchored navigation, gesture triggers, and thumb-friendly UI

The Problem

Many people are very used to being at home and don't get out much, which is unnatural for humans and unhealthy as well. So they need something to help them break out of that habit/comfort.

How Might We Question

HOW MIGHT WE simplify local event discovery for people trapped in stay-at-home routines, so that stepping outside and exploring their community feels effortless and rewarding?

The Solution

Get up & Go gamifies stepping out into the real world by surfacing local "Happenings" nearby. It leverages social accountability via "Circles" and rewards real-world check-ins with Go-Points (GP).

Target Market

Anyone struggling with stay-at-home inertia, from young adults to remote workers, working professionals, or newcomers to a city, who wants to break out of a sedentary routine and re-engage with their local community.

C) Core Features

SMART Objectives

1. *Product Delivery*

Develop and deploy a functional React Native mobile app (Goer) and a Firebase-backed Web Portal (Partner & Admin) within 3 weeks (21 days), successfully passing end-to-end testing for user onboarding, event browsing, and QR check-ins.

2. *Core Habit-Breaking Mechanics*

Achieve a 100% success rate in awarding Go-Points (GP) and updating user streak metrics upon a verified QR code check-in during MVP testing.

3. *Geolocation Performance & Battery Optimisation*

Ensure local Happening discovery queries return relevant events within a user-selected radius (e.g., 1–15 km) in under 2 seconds, utilising on-demand GPS fetching to eliminate background battery drain.

4. *One-Handed Ergonomics & Usability*

Ensure 100% of primary interactive touch targets (navigation buttons, RSVP triggers, 'Me Too' actions, and drawer toggles) are placed within the lower 60% of the screen ('Thumb Zone') and pass single-handed usability testing with 0 critical reach errors.

MVP (Must-Have):***Authentication & Onboarding***

The entry point to the app using Firebase Auth for signup/login, paired with an onboarding flow that explains the app's value and requests necessary permissions (GPS location and camera access). Securely establishes user accounts and immediately gains permission to use the device features that power the app. Without user accounts, data cannot be linked to specific Goers. Furthermore, geolocation and camera access are core requirements of the brief; obtaining these permissions during onboarding is non-negotiable.

My Circles

A social hub where Goers can create or join smaller groups ("Circles") using unique user codes and view a real-time activity feed ("WWD - What We Doing") of what their friends are attending. Drive social accountability and leverage peer influence to motivate users to leave the house. Social motivation is a core pillar of solving "stay-at-home inertia." The WWD feed and "Me Too" one-tap RSVP features are critical to reducing friction for going out.

Happenings Nearby

A location-based discovery screen that displays events ("Happenings") within a user-customised radius, featuring event details, an "RSVP Yes" button, and a QR code check-in camera scanner. Happenings Nearby connects users with real-world activities happening in their immediate vicinity and verifies real-world attendance. It directly fulfils the "Geolocation" prompt card requirement and provides the core utility needed for users to break their indoor habits.

Gamification System

The underlying points engine that awards Go-Points (GP) for checking into Happenings, maintaining activity streaks, and social engagement, pushing users up a linear level-progression system. Turns real-world outings into a rewarding, habit-forming experience through positive reinforcement. Directly addresses the "Break a habit" prompt

card. Without a point system, there is no immediate feedback loop rewarding users for changing their behaviour.

Settings (Accounts & Privacy)

A right-sliding drawer that allows Goers to manage their basic profile (username, profile pic), copy/share their user ID, control location-sharing visibility, or delete their profile. This gives users control over their personal data, identity, and privacy. Basic account management and location-privacy toggles are essential for user trust, safety, and standard app store release guidelines.

Web Portal (Partner)

A lightweight web dashboard for local businesses and event hosts to register, publish local "Happenings" (with location/time coordinates), and download venue-specific QR codes, to populate the mobile app with real-world events without needing complex external integrations. Without a stream of events, the Goer app would be empty. Building this as a simple web portal keeps the mobile codebase focused solely on the Goer experience while solving the event supply issue within the 3-week timeline.

Nice-to-Have:

Settings (Preferences & Help)

An extension of the mobile app's settings drawer containing visual customisation (light/dark mode toggle, font size adjustments, unit measurements) and a basic Help/Support FAQ section. Improve usability, accessibility, and user support. While accessibility features are great for UX, missing a font slider or dark mode toggle will not break the core loop of finding events and scanning QR codes during initial MVP testing.

Push Notifications

Automated system alerts for friend updates ("Ping Me"), upcoming RSVPs, or local trends. Re-engage users and remind them of upcoming real-world events. Native push

notification logic adds significant setup overhead in React Native. In the MVP, social feed updates visible upon opening the app are sufficient to test the concept.

Web Portal (Admin)

A web dashboard for platform moderators to review flagged/reported Happenings and manage support tickets. The admin portal keeps event content safe, accurate, and high quality. During initial MVP testing with controlled user groups, bad content can be manually deleted directly from the Firebase console, making a dedicated admin dashboard non-essential for launch.

My Circles (Leaderboard)

A monthly visual ranking (1st, 2nd, 3rd podium) of members within a Circle based on their earned GP. Adds competitive social fun and encourages friendly rivalries. While a great motivator, displaying a simple feed of friend activities ("WWD") achieves basic social proof. The leaderboard can be easily enabled once base GP tracking is working reliably.

Live Location Sharing

Background GPS tracking that updates a user's location in real time for friends or triggers automatic proximity alerts ("Ping Me"). Continuous background tracking consumes significant battery life and requires complex background task permissions in React Native. On-demand location queries in the MVP provide the necessary functionality without the performance cost.

Future Considerations:

Biometric Authentication

Logging into the mobile app using device hardware like FaceID or TouchID to provide fast, passwordless security. Firebase Authentication natively persists user sessions on the device. Adding local device keychain security adds unnecessary technical risk to a strict 3-week development sprint.

Google Places API

Pulling commercial events and venue data dynamically from Google Maps and social APIs instead of relying solely on Partner signups. Automatically populates any city with thousands of local activities. API rate limits, complex data formatting, and filtering for relevant "Happenings" take significant time to configure properly. Partner-created events provide a cleaner, controlled environment for the initial release.

Circles in-app direct messaging

A real-time chat interface inside each Circle allows members to text each other about upcoming plans, to centralise event coordination within the app. Building a full-featured real-time chat engine (with message history, read receipts, and media uploads) is a massive project on its own. Users already have existing messaging apps (WhatsApp, iMessage) to coordinate logistics outside Get Up & Go.

User Role Declaration

Goer (Mobile App User)	Partner (Business / Event Host)	Admin (Platform Moderator)
Platform: React Native Mobile App Access: Explores events, earns GP, manages circles, checks in via QR code and controls profile settings.	Platform: React Web Portal Access: Creates and manages commercial "Happenings," generates static venue QR codes for check-ins.	Platform: React Web Portal Access: Handles reported events and reviews Help & Support tickets.

User Flows

User Journey 1 (New Goer Breaking Routine)

"As a homebody feeling stuck indoors, I want to see low-friction events happening within 5km of me, so that I can easily go outside, check in via QR code, and earn GP to level up."

Flow

Open App → Onboarding & Permissions → Browse Happenings Nearby → Tap "RSVP Yes" → Arrive at Venue & Scan QR Code → GP Earned & Streak Updated.

User Journey 2 (Goer planning on attending the same events as her friend)

"As a Circle member, I want to see what my friends are planning in our group feed, so that I can join them with a single tap."

Flow

Open "My Circles" → View WWD Feed → See "*Goer A is attending Friday Night Market*" → Tap "Me Too" → Instant RSVP → Feed Activity Log Updated for Circle.

User Journey 3 (Partner creates new 'Happening')

"As a local venue owner, I want to list my weekend live music event on G&G and print a QR code, so that nearby users are driven to my physical location."

Flow

Open Web Portal → Log into Partner Web Portal --> Fill "Create Happening" Form (Name, GeoPoint, Time) → Submit to Firestore → System generates unique QR Code → Partner downloads/prints QR code for venue display.

D) Technical Planning

Tech Stack

Frontend: React Native (Mobile App), React (Partner/Admin Web Portal)

Backend/BaaS: Firebase (Firestore Database, Firebase Auth)

Native APIs: Geolocation API, QR scanning (via `react-native-vision-camera`).

NoSQL – Firebase Collections

Firebase Collections work very differently from SQL tables; they don't work with primary and foreign keys (that is only below to indicate collection relationships). It also uses denormalisation in some cases to avoid recalling a whole record; it stores a specific property from that entity into another entity, the literal opposite of normalise, which is a best practice in SQL databases. Also prefers to have object arrays within its entity where applicable instead of a whole new entity.

Challenges & Mitigation

- **One-Handed Navigation Constraints:** Replaced traditional top-bar navigation with bottom-anchored sheets and side-swipe drawers.
- **GPS Battery Drain:** Fetching location only during active radar queries and check-in verifications rather than continuous background polling.
- **Firestore NoSQL Optimisation:** Utilising denormalisation (e.g., storing event titles directly inside feed objects) to reduce read operations.

E) Wireframes & UI/UX Considerations

Design System & Brand Identity

The visual identity of *Get Up & Go (G&G)* is crafted to feel inviting, motivating, and lighthearted. Designed to encourage users to break out of stay-at-home routines, the aesthetic avoids overly aggressive or clinical tech aesthetics in favour of a playful, organic environment. By pairing a soft, high-contrast canvas with a vibrant secondary accent, the design system creates a friendly, low-pressure atmosphere that turns real-world exploration and habit-breaking into an enjoyable, rewarding journey.

Style Tile

Colours:

The G&G palette prioritises accessibility, hierarchy, and visual comfort by leveraging structured primary, secondary, and neutral spectrums. The heavy reliance on distinct tints and shades ensures high contrast for readability without visual clutter:

- **Beige (#F4F0DD canvas):** Serves as a warm, off-white background spectrum that reduces eye strain compared to harsh #FFFFFF screens, offering a gentle, grounded canvas.
- **Indigo (#A88AED primary):** Used for primary action buttons, brand accents, and active UI elements to convey trust, clarity, and focus.
- **Celery (#A6C261 secondary):** Represents growth and achievement, heavily utilised for gamification elements (Go-Points, level progress bars, and success badges) to provide positive reinforcement.
- **Tints & Shades:** Extended colour spectrums (from deep midnight indigo to soft mint green and neutral charcoal) allow for seamless dark mode adaptations, subtle state changes (hover/pressed buttons), and accessible text contrast ratios across all components.

Typography:

- **A Day Without Sun (Headers & Display Copy):** Designed by Cosimo Lorenzo Pancini and Debora Manetti (Adobe Fonts), this expressive display typeface gives G&G its signature playful tone. Its organic, handwritten quality makes headers feel personal and non-intimidating, perfectly aligning with a soft habit-breaking narrative.
- **Arial (Body Copy & Microcopy):** Paired directly with the display font to ground the UI with clean, crisp structure. Arial's neutral, highly legible sans-serif letterforms ensure that event details, settings text, and navigation labels remain effortless to scan on mobile screens at any scale.

Iconography:

- **Lucide Icons System:** To complement the visual hierarchy, G&G utilises the Lucide icon library. Chosen for its clean, uniform stroke weights and geometric curves, Lucide icons seamlessly integrate with both Arial and A Day Without Sun.
- **One-Handed Usability:** Icons are used consistently across bottom navigation items, drawer triggers, and action buttons to ensure instant visual recognition—allowing users to comfortably navigate the app one-handed without relying heavily on reading dense text labels.

Key Wireframe Screens

All Wireframes: Wireframes

Considerations

One-handed UX

- Floating pill-shaped bottom navigation bar.

- Right-sliding drawer for Settings to maximise swipe-to-dismiss reach.
- Bottom-sheet modal for Circlees management.

Accessibility

- WCAG-compliant text contrast using dark shades for body text.
- Dynamic font sizing options and dark/light toggle support.

F) Project Roadmap

Overview & Explanation

Due to the time constraint of about 3 weeks to create this app and portal, every timeline decision has had to be so intentional as to not rush the app and to finish it in time for presentations.

Week 1 – Infrastructure & Authentication

The first week is focused on the backend implementation: Firebase Auth and Firestore collections. I will also set up user RBAC and all the onboarding for the Mobile app. I also want to tackle the pill-shaped navbar.

Week 2 – Mobile App

This week will be for building all the feature screens and implementing the QR scanner, geolocation and Go-Point system.

Week 3 – Web Portal, Debug & Polish

For week 3, I will spend 2-3 days building the simple Partner/Admin web dashboard for event creation and moderation of reports and support tickets. The rest of the week will be used for UI polishing, gesture tuning, dark mode testing, and final deployment.

Week 4 – Admin & Crisis Management

In the final week, I will record my demo video and finalise my README file and presentation. This week is reserved for anything unexpected to happen, like deployment failures or bugs appearing, etc.

Trello Timeline

Trello Board Link:

<https://trello.com/invite/b/6a5d32b0d9898b24b22ad0db/ATTI3fb2994d7c1e55534ed9a5a0ec3690d719AF4B38/get-up-go>

G) Conclusion

Get Up & Go (G&G) directly addresses the growing issue of stay-at-home inertia by transforming local event discovery into a rewarding, habit-breaking social experience. By directly synthesising the core constraint cards, "Break a habit," "Geolocation," and "One hand usage only", the platform creates a low-friction ecosystem that motivates users to step out of their comfort zones and re-engage with the physical world.

Through a well-scoped 3-tier Role-Based Access Control (RBAC) model, G&G balances a feature-rich, thumb-friendly mobile experience for Goers with a lightweight web management portal for local Partners and Admins. Utilising Firebase for real-time data persistence, authentication, and geolocation indexing ensures that the system architecture remains performant, secure, and highly scalable.

Most importantly, the technical and design choices detailed throughout this proposal, from on-demand GPS fetching to offloading partner tools to the web, have been ruthlessly

prioritised to ensure successful delivery within the 3-week development sprint. Get Up & Go stands as a highly achievable, engaging, and impactful MVP that proves real-world habits can be broken through intentional, gamified design.
